

AJA | Diskover Media Edition

1 Client needs to establish if they want to use global cost per GB* or assign custom costs. See #5 and #6 for the latter. In either case, costs* are estimated independent of the AJA Diskover Media Edition software and are simply configured into the AJA Diskover Media Edition application.

2 Costs* estimates can be entered as a global value or on a per storage volume basis, see #5 for the later.

3 Cost calculations can be granularly controlled based on configurable parameters.

4 Costs can be calculated either on a base **10 (decimal system)** or base **2 (binary)**.

5 Costs can be calculated by either actual file size (size) or amount of space file consumes on storage (size_du).

6 If different cost per storage volume or directory is desired, the cost per path is entered at this stage, overriding the global cost entered at #2.

7 Different costs can also be configured by the aging of files (ex: mtime, atime, ctime).

8 When AJA Diskover Media Edition is looking for costs and a match is in both #5/paths and #6/times, the priority between paths and times is selected at this stage. Costs in #5 and #6 will not be added.

9 Costs analysis queries can be customized with one or several criteria to achieve your business objectives, ex: project, customer, aging, tags, storage volume, etc.

10 The cost associated with files, directories, users, etc. is also available in other views throughout Diskover like the Search page and User Analysis.

** Cost/GB: Calculation of the storage casts are estimated outside of Diskover. Beside the costof the storage itself, other factors can be compounded, for example: electr/city, square footage, Sys Admin salary, AJA Diskover Media Edition's annual subscription cost, etc.*

Storage Cost Configuration Overview
